

Enigma Assignment 2025

For the assignment I've used

Backend : SpringBoot, Hibernate, Rest APIs,

Database : MySQL

Testing : Postman and Swagger

Backend :

- Firstly I created a Plain Old Java Object (pojo) class so as to form a table where I've used Hibernate and JPA
- Next was the Data Access Object Layer(dao) which is an interface, which we used to get the data from pojo class
- Then I made Service interface and Service Implementation for all the CRUD operations.
- And then the Controller layer which provides the response through REST APIs to the server.
- And also one more class was of Custom Exception class, this provided exact error message in concise form.

Database :

I used MySQL database where Hibernate already created the tables for viewing it and storing it I used MySQL.

Testing :

For testing I generally prefer swagger, but as mentioned in the assignment I used both Postman and swagger.
